OPEN AND ENROLLING

EPIC message: *Research MHIF Patient Referral*

CONDITION:
Heart Failure

PI:
Peter Eckman, MD

RESEARCH CONTACT:
Kari Thomas & Sarah Schwager
Kari.m.thomas@allina.com 612-863-7493
Sarah.Schwager@allian.com 612-863-6257

SPONSOR:
Abbott Vascular

DESCRIPTION:

The purpose of this study is to understand if aspirin is needed in subjects implanted with HeartMate 3. Subjects with devices like HeartMate 3 take two blood thinner medicines, specifically warfarin and aspirin. Subjects often experience both clotting and bleeding complications.

Data suggests that the HeartMate 3 may not require as much anticoagulation as are used with similar devices. This study will test if subjects need aspirin together with warfarin or just warfarin alone.

CRITERIA LIST/ QUALIFICATIONS:

Inclusion:

- Subjects will receive the HeartMate 3 as their first LVAD

Exclusion:

- Post implant additional temporary or permanent mechanical circulatory support (MCS)
- Investigator mandated antiplatelet therapy for other conditions

4

Cardiogenic shock - definition

Clinical / laboratory

- Altered mentation
- SOB
- Abdominal pain/N/V
- Cool periphery
- Pulmonary congestion
- Low urine output
- Lactic acidosis and $\downarrow\text{HCO}_3$

Based on Hemodynamics

- Persistent hypotension
 - Systolic BP $< 80-90$ mmHg or
 - MAP < 60 mmHg or 30 mmHg below baseline in pts with HTN
 - Cardiac Index < 2.2 without support or < 2.0 L/min/m² with moderate/maximal support
 - Elevated Filling Pressures
 - LVEDP > 18 mmHg
 - RVEDP $> 10-15$ mmHg

SCAI Stages of Cardiogenic Shock

Adapted from the SCAI Clinical Expert Consensus Statement on the Classification of Cardiogenic Shock
Endorsed by ACC, AHA, SCCM, and STS

Arrest (A) Modifier:
CPR, including defibrillation

EXTREMIS
A patient being supported by multiple interventions who may be experiencing cardiac arrest with ongoing CPR and/or ECMO.

DETERIORATING
A patient who fails to respond to initial interventions. Similar to stage C and getting worse.

CLASSIC
A patient presenting with hypoperfusion requiring intervention beyond volume resuscitation (inotrope, pressor, or mechanical support including ECMO). These patients typically present with relative hypotension.

BEGINNING
A patient who has clinical evidence of relative hypotension or tachycardia without hypoperfusion.

AT RISK
A patient with risk factors for cardiogenic shock who is not currently experiencing signs or symptoms. For example, large acute myocardial infarction, prior infarction, acute and/or acute on chronic heart failure.

SCAI Classification to Predicts Mortality in the CICU

- Retrospective analysis of Mayo Clinic CICU patients admitted with CS between 2007 and 2015.
- Each higher SCAI shock stage was associated with increased hospital mortality compared with SCAI shock stage A
- was 46.0%, 30.0%, 15.7%, 7.3%, and 1.0%
- Unadjusted hospital mortality in these stages was 3.0%, 7.1%, 12.4%, 40.4%, and 67.0% (p < 0.001),

SCAI Classification after Cardiac Arrest

- The SCAI classification is a step-wise significant increase in 30-day mortality with increasing shock grade:
- 393 patients were classified into 5 stages
- Stage A 28.9%
- Stage B 33.0%
- Stage C 54.5%
- Stage D 59.3%
- Stage E 82.9%
- Stage A - Need for RRT
- Stage B - Multiorgan failure

14

Cardiac Power Output

- $CPO = MAP \times CO / 451$.
- Normal > 0.6

In the SHOCK trial, CPO was the hemodynamic variable **most strongly** associated with in-hospital mortality

Fincke R et al. Cardiac power is the strongest hemodynamic correlate of mortality in cardiogenic shock: a report from the SHOCK trial registry. *J Am Coll Cardiol.* 2004;21;44(2):340-348.

17

HUP Shock Team

- Overall Goals of the Shock Team
 - Pathway development, with continual knowledge of the literature
 - Rapid patient identification
 - Mechanism of action
 - Transfer center
 - Expedited decision making by the shock team: "Go or no-go"
 - Bedside rounds as able, virtual rounds
 - "Go": patient has a potentially treatable insult and/or has an Exit plan (durable or without an exit plan (ie: not a durable VAD candidate))
- Improving outcomes of success
 - Once it is a "go" immediate mobilization of the appropriate team members and deployment of support

CORONARY ARTERY DISEASE

Improved Outcomes Associated with the use of Shock Protocols: Updates from the National Cardiogenic Shock Initiative

Basir, MB et al. *Catheter Cardiovasc Interv*, 2019, April, Vol 93, Issue 7.

19

National Cardiogenic Shock Registry

- 35 sites
- 49% had
- All centers followed standard protocol
- Average
- Average
- 74% of patients had MCS implanted prior to PCI.

- Survival to discharge was 72%. % male

- Predictors of mortality:

- Creatinine ≥ 2 ,
- lactate >4 ,
- (CPO) <0.6
- age ≥ 70 .

standard rapid

rapid

20

IABP-SHOCK II Predictors

- Identified **6 variables** predictive of 30-day mortality
- Subsequently validated in external cohort

Clinical Parameter	Score
Age >73	1
Prior stroke	2
Glucose >191	1
Creatinine >1.5	1
TIMI <3 after PCI	2
Lactate (a) >5	2

21

Predictors of Survival after VA ECMO

SAVE

Survival After Venous-arterial ECMO

The SAVE Score has been developed by ELSO and The Department of Intensive Care at The Alfred Hospital, Melbourne. It is designed to assist prediction of survival for adult patients undergoing Extra-Corporeal Membrane Oxygenation for refractory cardiogenic shock. It should not be considered a substitute for clinical assessment.

For more information see: [Predicting survival after ECMO for refractory cardiogenic shock: the survival after veno-arterial-ECMO \(SAVE\) score](#)

The patient's SAVE Score is **-6**

Diagnosis:

- Myocarditis
- Refractory VT/VF
- Post heart or lung transplantation
- Congenital heart disease
- Other diagnoses

Age (years):

- 18-38
- 39-52
- 53-65
- 66
- 67-80
- 81-90

Weight (kg):

- <65
- 65-85
- >85

Cardiac:

- Pulse pressure pre ECMO <20 mmHg
- Diastolic BP pre ECMO <40 mmHg
- Pre-ECMO cardiac arrest

Respiratory:

- Peak respiratory pressure >20 cmH₂O
- Intubation duration pre ECMO (>6h)

Renal:

- Acute renal failure
- Chronic renal failure
- HCO₃ pre ECMO <15 mmol/L

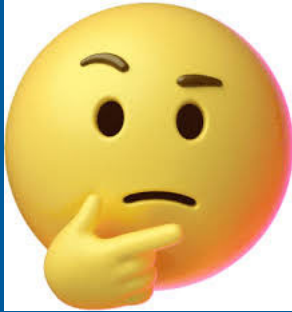

Other organ failures pre ECMO:

- Central nervous system dysfunction
- Liver failure

Schmidt M et al. Eur Heart J. 2015 Sep 1;36(33):2246-56.

Impella CP/5.0 vs VA ECMO

- A - 128 patients were included
- Th - Impella, N=90, VA ECMO, N=38
- Se - 30-day mortality 53% vs. 49%, ($P=0.3$),
- col - Less device related complications with Impella
- ac - than VA ECMO (17% vs. 40%, $P < 0.01$)

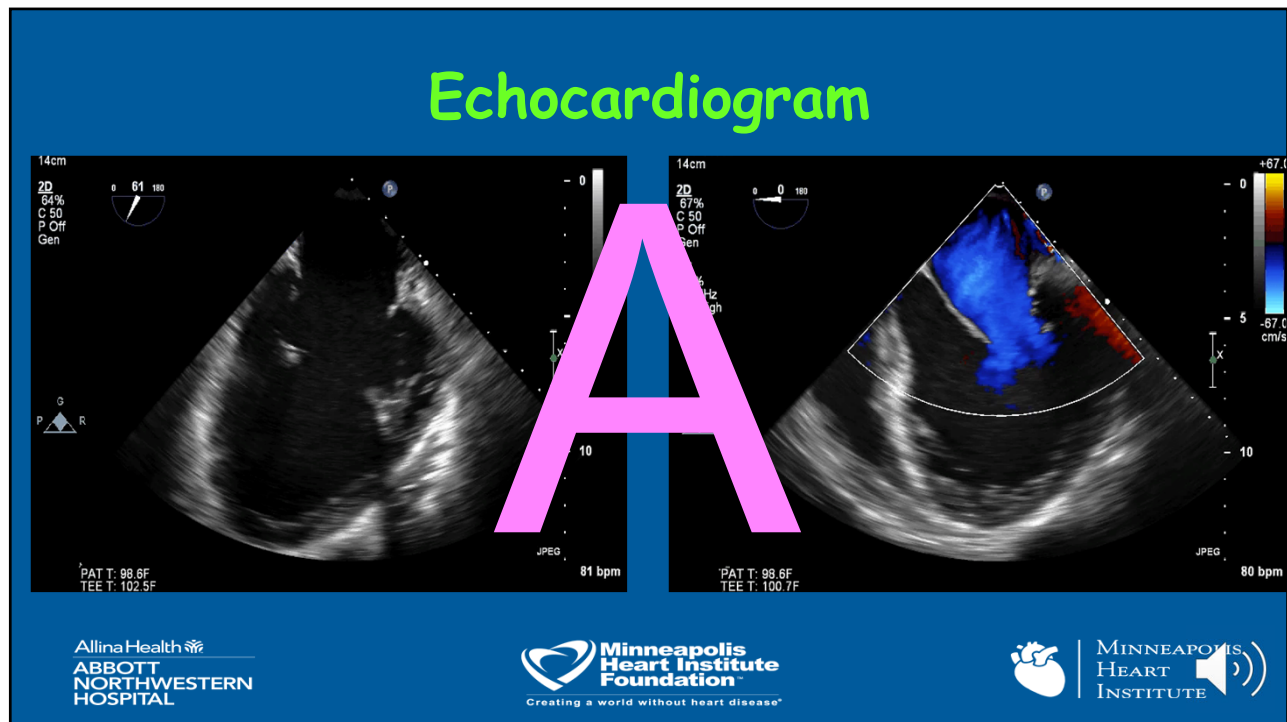

Karami M et al. Eur Heart J Acute Cardiovasc Care 2020 Mar;9(2):164

25

Case

- 56 years old male with end stage non - ischemic CM
- Evaluated for advanced HF therapies
- Discharged per his request with borderline but stable hemodynamics and scheduled for LVAD placement in 2 weeks

26

27

Case

- Readmitted with worsening SOB at rest, dizziness, hypotension, MAP 58
- Creatinine up to 2.3, lactate 19, AST/ALT 95/110
- RHC with RA 17 PA 17 SVT MAP 36 Fick CO/CI 4.4/2.1
- CPO 0.6 (Normal > 0.5)
- Started on dobutamine gtt with initial improvement in hemodynamics

B

PAT T: 98.6F

28

Case

- Feeling poorly again, MAPs low 60s, CI 1.8 despite escalating doses of inotropes
- Creatinine up again, lactate 2.8
- CPO 0.5

C

29

Case

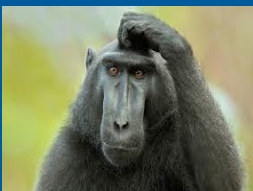

- IABP placed
- Mild improvement in hemodynamics, CI 1.9-2.1
- Creatinine stabilized at 2.2, LFTs remain elevated
Lactate initially down, but still 2-2.5

30

Case

- More tachycardic/borderline hypotensive
- Lactate trending up
- RA 16, PAP 50/27, CO 1.7 despite dobutamine at 5, milrinone at 0.5. Lactate six gtt at 40 mg/h, IABP 1:1
- CPO 0.4 PAPI 1.4
- Awake, but "struggling"

Improving Outcomes in INTERMACS 1 Category 1 Patients with Pre-LVAD, Awake Venous-Arterial Extracorporeal Membrane Oxygenation Support

Makoto Mori; Gerard McCloskey; Arnar Geirsson; Abeel A. Mangi; James J. Yun; Daniel Jacoby; Tariq Ahmad; Lavanya Bellumkonda; Forrester Lee; Michael E. Chen; Pramod Bonde

- 19/83 received aVA ECMO support before durable LVAD.
- Mean aVA ECMO support → 2.7 days.
- Survival of aVA ECMO patients was comparable with that of non-aVA ECMO INTERMACS 2 cohort (84.2% vs. 80.8%) at 1 year.

5

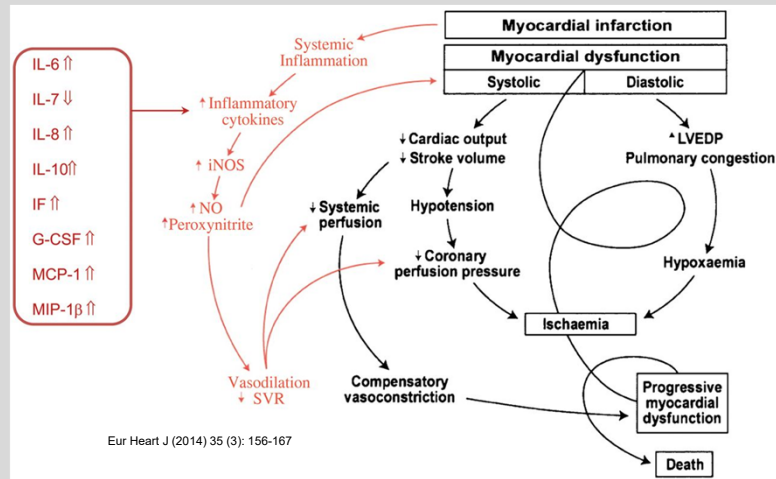

The Problem

Cardiogenic shock continues to be associated with poor survival

6

Cardiogenic Shock: The Gunfight

7

Definition?

- IMPRESS Trial
 - SBP < 90 for 30 minutes
 - Pressors for SBP > 90 min
 - Signs of hypoperfusion
 - All patients intubated
 - 90% cardiac arrest
 - 20 minutes to ROSC
 - 70-80% hypothermia
 - Lactate > 7.8, pH 7.1-7.2
- IABP SHOCK II Trial
 - SBP < 90 for 30 minutes
 - Pressors for SBP > 90 min
 - Signs of hypoperfusion
 - Pulmonary Congestion
 - Lactate > 2.0, altered mental status or UO < 30cc/hr

8

SCAI Stages of Cardiogenic Shock

SCAI Stages of Cardiogenic Shock
Adapted from the SCAI Clinical Expert Consensus Statement on the Classification of Cardiogenic Shock
Endorsed by ACC, AHA, SCCM, and STS

Arrest (A) Modifier:
CPR, including defibrillation

EXTREMIS
A patient being supported by multiple interventions who may be experiencing cardiac arrest with ongoing CPR and/or ECMO.

DETERIORATING
A patient who fails to respond to initial interventions. Similar to stage C and getting worse.

CLASSIC
A patient presenting with hypoperfusion requiring intervention beyond volume resuscitation (inotropes, pressors, or mechanical support including ECMO). These patients typically present with relative hypotension.

BEGINNING
A patient who has clinical evidence of relative hypotension or tachycardia without hypoperfusion.

AT RISK
A patient with risk factors for cardiogenic shock who is not currently experiencing signs or symptoms. For example, large acute myocardial infarction, prior infarction, acute and/or acute on chronic heart failure.

Baran DA, Grines CL, Bailey S, et al. SCAI clinical expert consensus statement on the classification of cardiogenic shock. *Catheter Cardiovasc Interv.* 2019;1-9. <https://doi.org/10.1002/ccd.28329>

Cardiogenic Shock

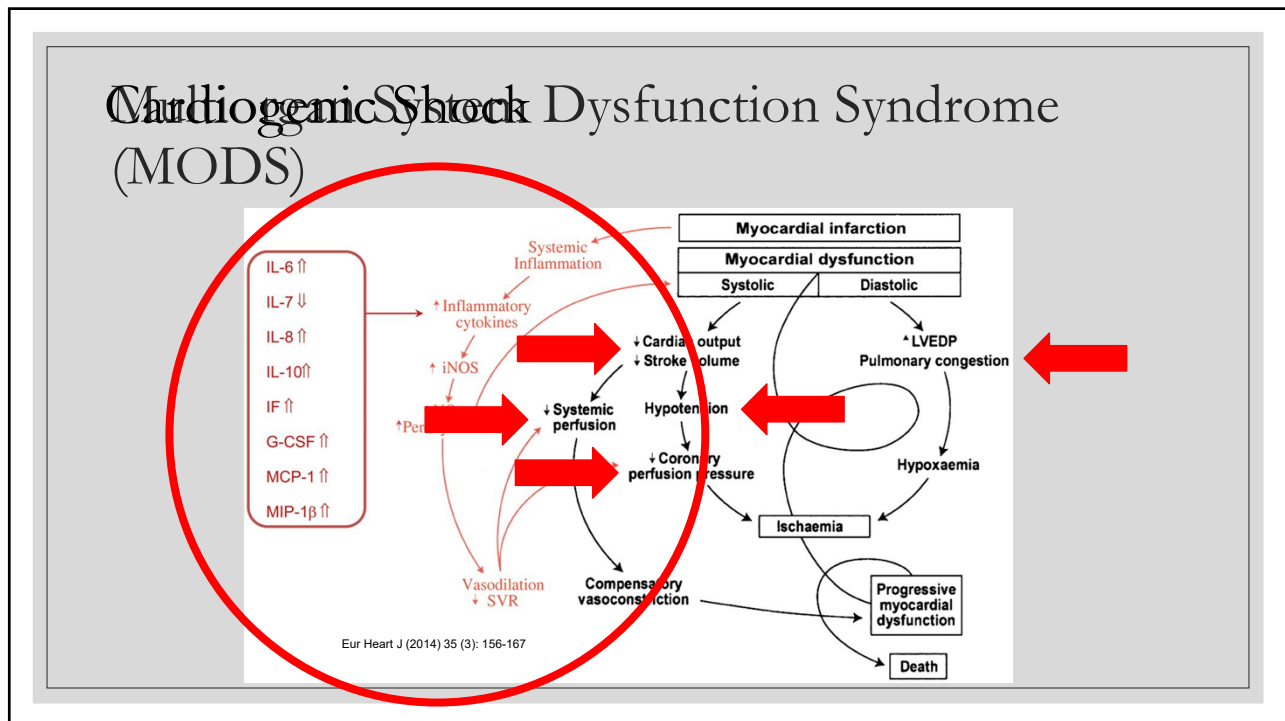

Fux et al. J Am Coll Cardiol. 2017 Oct 17;70(16):2094-2096

28

29

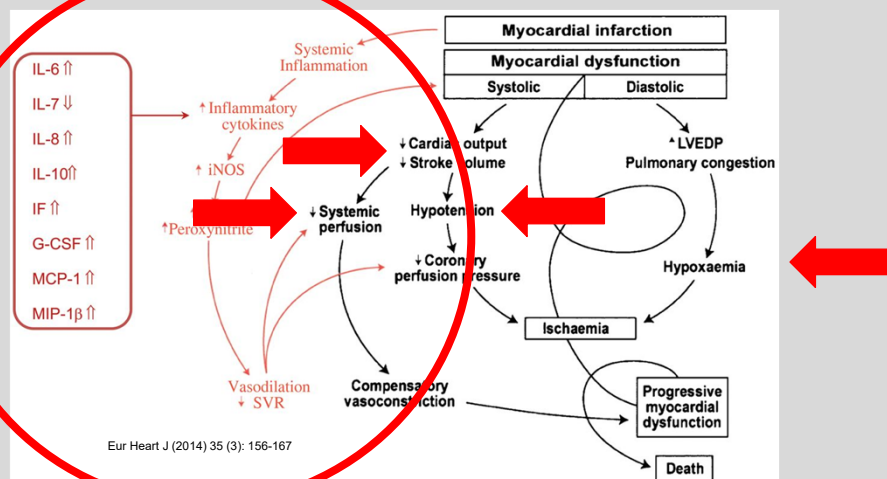

30

Cardiogenic Shock

- NOT simply due to a decrease in cardiac contractile function
- A multiorgan system dysfunction syndrome (MODS)
 - Resulting from refractory peripheral tissue hypoperfusion and microcirculatory dysfunction
 - Systemic inflammatory response syndrome (SIRS)
 - Vasodilatory response
 - Sepsis syndrome
- Once MODS develops it is difficult to reverse
 - Increasing cardiac output is insufficient
 - Aggressive MCS devices placed in a timely fashion are needed

31

Cardiogenic Shock: VA ECMO

32

TABLE 2

Options for short-term circulatory support

	IABP	TandemHeart	Impella 2.5	Impella CP, 5.0	ECMO	CentriMag
Circulatory support	15%	30%–60%	30%–60%	75%–100%	75%–100%	75%–100%
Insertion	Percutaneous	Percutaneous, septal puncture	Percutaneous	Arterial access	Percutaneous	Sternotomy

ECMO = extracorporeal membrane oxygenation; IABP = intra-aortic balloon pump

Cleveland Clinic Journal of Medicine. 2017 April;84(4):287-295

33

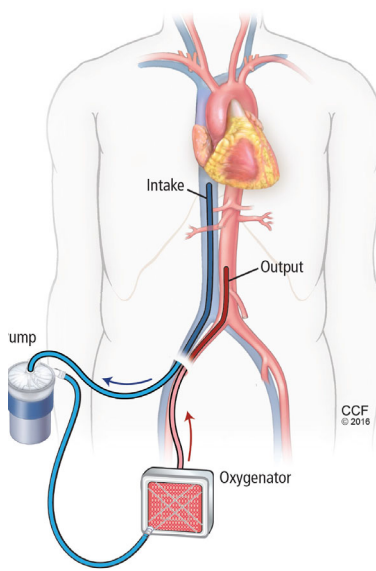

FIGURE 2 Comparison of MCS Devices and Their Impact on Cardiac Flow

Four main families of devices exist for percutaneous MCS, which includes IABP, Impella (Abiomed Inc., Danvers, Massachusetts), TandemHeart (CardiacAssist, Inc., Pittsburgh, Pennsylvania), and VA-ECMO. Each device provides a different level of cardiac flow and device selection should be tailored to the level of support needed. Abbreviations as in Figure 1.

JACC: CARDIOVASCULAR INTERVENTIONS VOL. 9, NO. 9, 2016 MAY 9, 2016:871–83

34

CCF © 2016

Cleveland Clinic Journal of Medicine. 2017 April;84(4):287-295

V-A ECMO

- Centrifugal, nonpulsatile pump for blood propulsion
- Membrane oxygenator for gas exchange
- Venous cannula (25 F) drains deoxygenated blood into a membrane oxygenator for gas exchange
- Oxygenated blood is subsequently infused into the patient via an arterial cannula (15-17F)
- Systemic flows greater than 5L
- Best device in refractory shock

35

V-A ECMO

- Hemodynamic effects
 - Systemic flows 5-6L depending on cannula size
 - Rapid correction of deleterious metabolic derangements related to cardiogenic shock
 - Likely the best MCS device for management of MODS
 - Increased myocardial oxygen demand on basis of increased volume and filling pressure
 - Unless LV unloaded (Impella or IABP) or vented (surgical vs. atrial septostomy)

36

37

Cardiogenic Shock

- AMI etiologies
 - Acute LV/RV dysfunction and systolic pump failure
 - Acute structural complications
- Non AMI etiologies
 - End stage non-ischemic CM
 - Post-cardiotomy syndrome
 - Acute allograft failure
 - Acute myocarditis
 - End stage valvular and structural disease
 - Refractory arrhythmias
 - Massive pulmonary embolism
 - Drug overdose

38

Devices for MCS: V-A ECMO

- Contraindications
 - Aortic insufficiency
 - Severe peripheral vascular disease
- Complications
 - Bleeding
 - Thrombosis
 - Embolic events/CVA
 - Vascular complications

39

VA ECMO in Refractory Shock and Cardiac Arrest

40

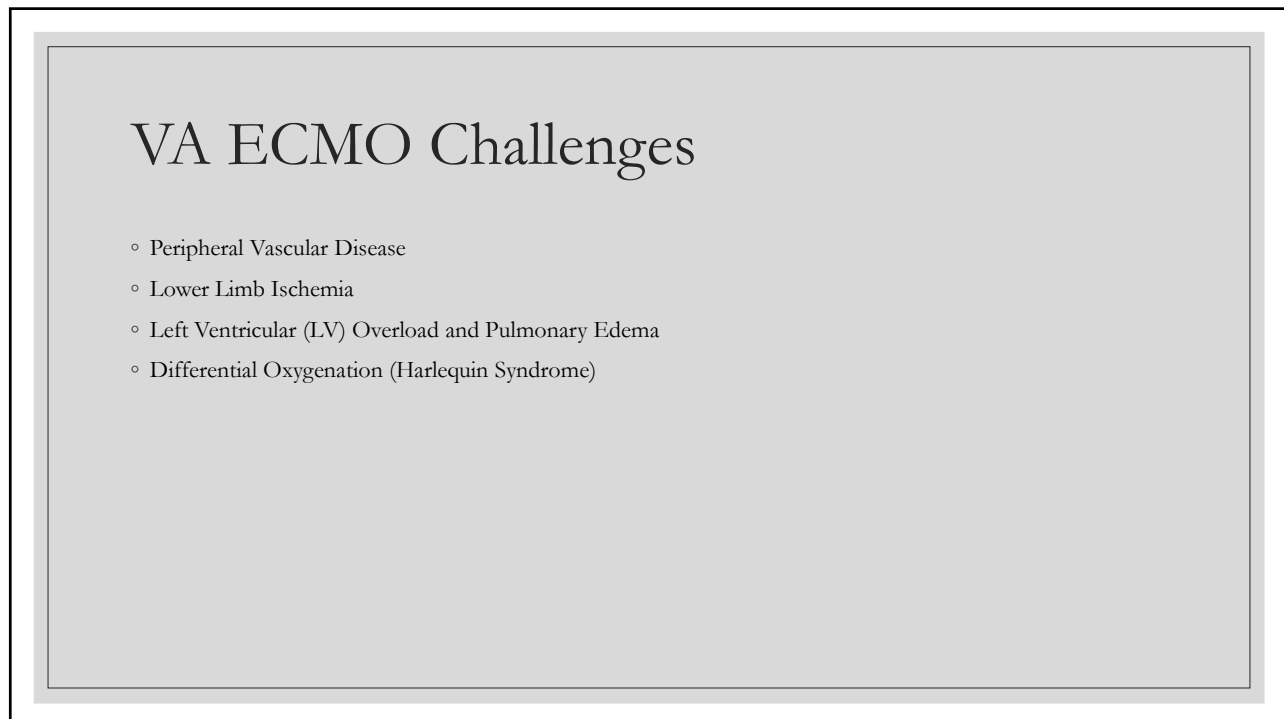

41

42

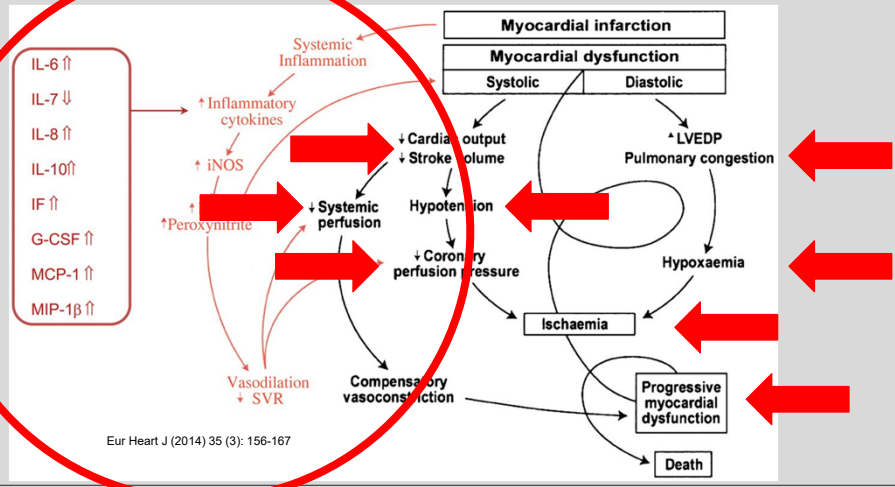

43

44

Cardiogenic Shock: VA ECMO

45

Coronary Tissue Perfusion

- Microvascular resistance
- Pressure gradient
 - Aortic pressure (MAP)
 - Coronary sinus (CS)/right atrial (RA) pressure
- Left ventricular end diastolic pressure (LVEDP)

46

Coronary Tissue Perfusion

- Acute MI
 - Microvascular resistance is high
 - LVEDP is elevated
- Cardiogenic shock
 - Decrease aortic pressure
 - Increase RA pressure
 - Increase in LVEDP
 - Decrease in end organ perfusion pressure

47

VA ECMO Limitations

- Significant LV mechanical overload
 - Increase myocardial ischemia
 - Increase myocardial oxygen demand
 - Impaired LV recovery
 - Adverse myocardial remodeling
 - Irreversible heart failure
 - LV dilation
 - Increase pulmonary capillary wedge pressure
 - Impaired gas exchange

48

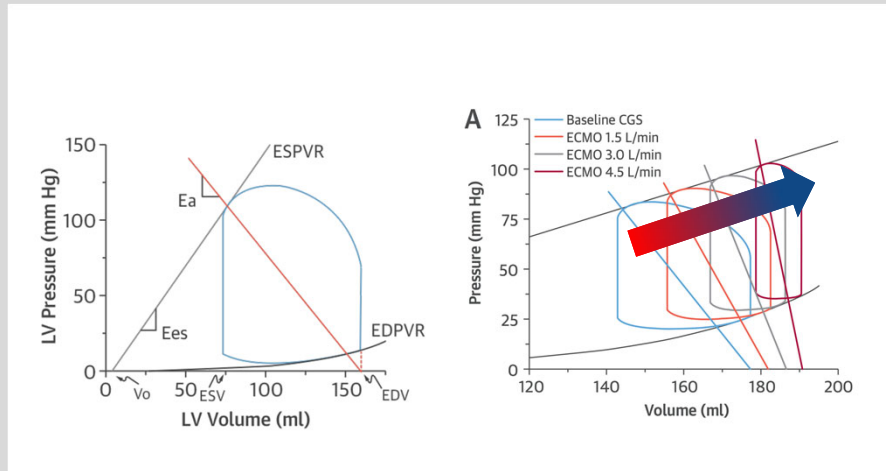

49

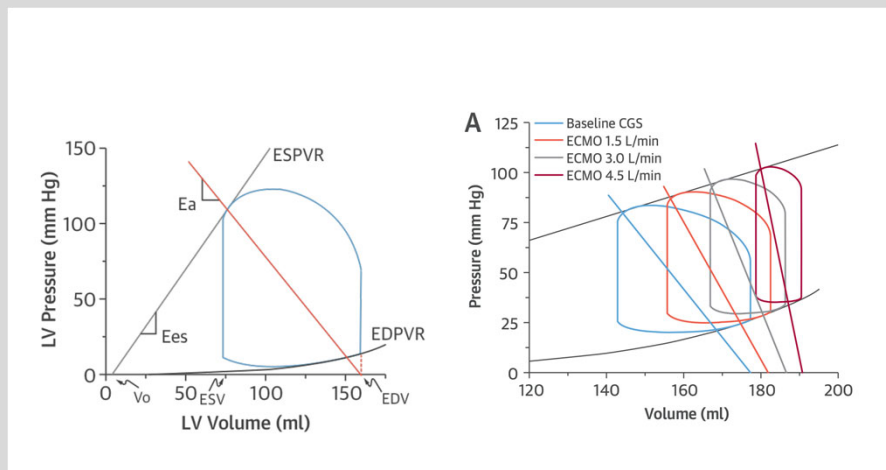

50

VA ECMO Limitations: LV Overload

51

VA ECMO Complications: LV overload

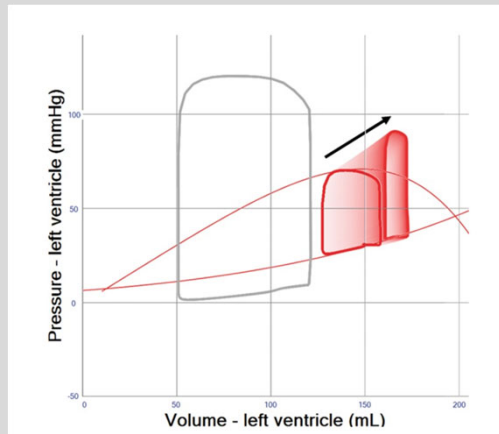

52

VA ECMO Complications: Pulmonary Edema

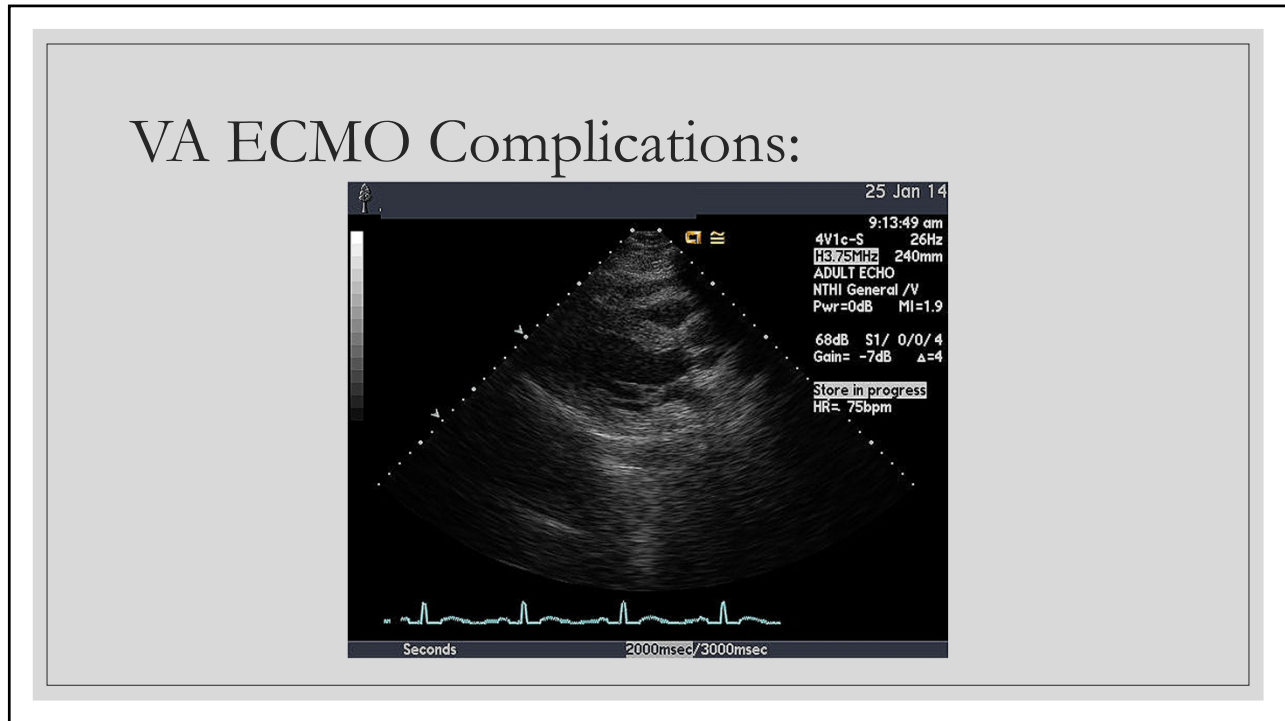

53

VA ECMO Limitation: LV Overload

D. Donker, D. Brodie, J. Henriques, M. Broomer ASAIO J. 2019 Jan; 65(1): 11–20.

54

55

56

VA ECMO Complications: LV overload Strategies

- Decrease ECMO flow
- Improve LV ejection with inotropes
- Unload the LV with vasodilators
- Intra Aortic Balloon Pump
- Atrial Septostomy
- Surgical vent
- Add Impella (ECPELLA)

57

ECMO Cannulation: Avoiding Complication

- Complication rates historically high
 - Major bleeding (40.8%)
 - Lower extremity ischemia (16.9%)
 - Compartment syndrome (10.3%)
 - Amputation (4.7%)
 - Stroke (5.9%)
- *Cheng, R. et.al.; Ann Thorac Surg 2014;97:610–616.*

58

Cardiogenic Shock: MCS Devices

Table 2 Comparison of devices

	IABP	ECMO	TandemHeart	Impella 2.5	Impella 5.0
Pump mechanism	Pneumatic	Centrifugal	Centrifugal	Axial flow	Axial flow
Cannula size	7.9 Fr	18–21 Fr inflow; 15–22 Fr outflow	21 Fr inflow; 15–17 Fr outflow	13 Fr	22 Fr
Insertion technique	Descending aorta via the femoral artery	Inflow cannula into the right atrium via the femoral vein, outflow cannula into the descending aorta via the femoral artery	21 Fr inflow cannula into left atrium via femoral vein and transeptal puncture and 15–17 Fr outflow cannula into the femoral artery	12 Fr catheter placed retrogradely across the aortic valve via the femoral artery	21 Fr catheter placed retrogradely across the aortic valve via a surgical cutdown of the femoral artery
Haemodynamic support	0.5 – 1.0 L min ⁻¹	> 4.5 L min ⁻¹	4 L min ⁻¹	2.5 L min ⁻¹	5.0 L min ⁻¹
Implantation time	+	++	+++	++	++++
Risk of limb ischaemia	+	+++	+++	++	++
Anticoagulation	+	+++	+++	+	+
Haemolysis	+	++	++	++	++
Post-implantation management complexity	+	+++	++++	++	++
Optional active cooling in post-cardiopulmonary resuscitation patients	No	Yes	(Yes)	No	No

ECMO, extracorporeal membrane oxygenation; IABP, intra-aortic balloon pump; +, ++, +++, +++++, relative qualitative grading concerning time (‘implantation time’), risk (‘risk of limb ischaemia’), intensity (‘anticoagulation’, ‘post-implantation management complexity’), and severity (‘haemolysis’). Modified from Ouweneel and Henriques.³²

59

60

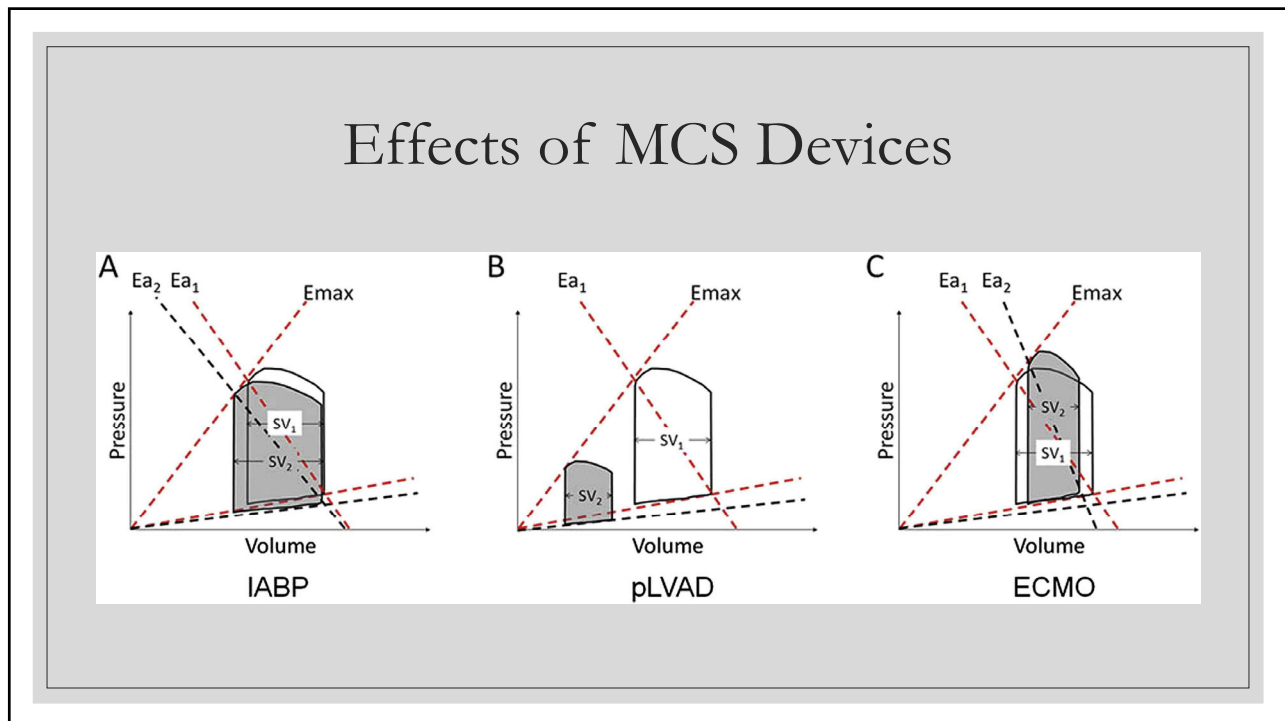

61

62

63

64

VA ECMO Challenges: Ischemic Lower Limb

- Limb preservation strategies
 - Vascular Surgery consultation
 - Continuous flow doppler of lower extremity
 - Near Infrared Spectroscopy (NIRS)
 - Lower than 40-50%
 - 20% differential compared to contralateral limb
 - Distal perfusion catheter
 - Placed by ultrasound guidance
 - 6 French short armored catheter.
 - Smaller arterial cannulas (No larger than 17 French)
 - Bilateral distribution of arterial and venous cannula

65

Longitudinal Plane Cannula Placement

66

Percutaneous Cannulation: Reperfusion Sheath

VA ECMO Challenges: Differential Hypoxemia

CARDIAC BLOOD FLOW **ECMO BLOOD FLOW**

A **B** **C**

72

73

VA ECMO Challenges: Differential Hypoxemia

- Potential Strategies
 - Right axillary arterial return cannula
 - Central cannulation
 - Hybrid configuration
 - VA-V ECMO

74

Differential Hypoxemia Management Strategies: Hybrid VA

The diagram illustrates two strategies for managing differential hypoxemia in ECMO. On the left, the VA (Venous Arterial) strategy shows a single cannula inserted into the femoral vein, which is connected to the ECMO circuit. On the right, the VAV (Venous Arterial Venous) strategy shows two cannulas: one inserted into the femoral vein and another into the femoral artery, both connected to the ECMO circuit. An inset photograph shows the physical cannulas with arrows indicating the flow directions.

75

Bilateral VA ECMO Cannulation

The photograph shows a patient's legs with two cannulas inserted into the femoral veins. An inset shows the Arrow Super Arrow-Flex Percutaneous Sheath Introducer Set, which is used for cannulation. The cannulas are connected to the ECMO circuit.

76

“....Brings a knife to a gunfight”

77

Definition?

- IMPRESS Trial
 - SBP < 90 for 30 minutes
 - Pressors for SBP > 90 min
 - Signs of hypoperfusion
 - All patients intubated
 - 90% cardiac arrest
 - 20 minutes to ROSC
 - 70-80% hypothermia
 - Lactate > 7.8, pH 7.1-7.2
- IABP SHOCK II Trial
 - SBP < 90 for 30 minutes
 - Pressors for SBP > 90 min
 - Signs of hypoperfusion
 - Pulmonary Congestion
 - Lactate > 2.0, altered mental status or UO < 30cc/hr

78

Impella in Cardiac Arrest: IMPRESS Trial

90

VA ECMO: The Big Gun?

- Provides the best hemodynamic support
- MCS device of choice for stage D and E shock
- Overloads the compromised LV
- Significant bleeding and vascular complications

91

VA ECMO: The Big Gun?

- Don't bring a knife to a gunfight
 - Early recognition using new SCAI definitions
- ECMO is not the only gun!
 - Optimal device selection
- Be careful how you shoot that gun!
 - Complication management

 - No: 9 **LV failure?**
 - Yes: **Pre-shock** → **IABP**
 - No: **Severe shock** → **Impella, Tandem Heart**
 - 1d Cardiac arrest**
 - VA-ECMO**

Contraindications for Impella? (3)

- Yes: **Support standby**
- No: 4 **Femoral access adequate?**
 - Yes: 5 **Alternative access feasible?**
 - Yes: **IABP**
 - No: **Impella**
 - No: **Impella**

Contraindications for IABP or ECMO? (6)

- Yes: **No support**
- No: **IABP** Or **VA-ECMO**

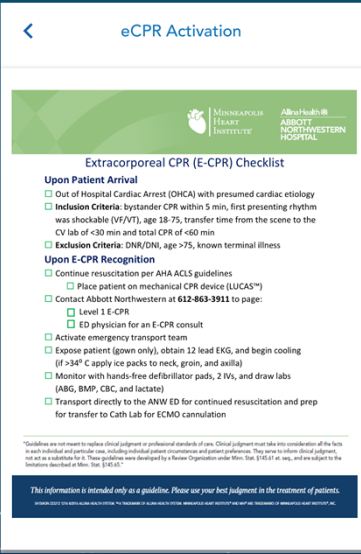

Notes:

- Unprotected LM, Last remaining vessel, Atherectomy, Retrograde CTO PCI → **No support**
- LV thrombus, Mechanical aortic valve, Severe aortic regurgitation, VSD or ASD → **Contraindications for Impella?**
- Iliofemoral >5 mm, No severe iliofemoral tortuosity → **Femoral access adequate?**

FIGURE 14.1 Determining whether hemodynamic support is needed and optimal device selection.

14

Selection Process (ECMO)

Extracorporeal CPR (E-CPR) Checklist

Upon Patient Arrival

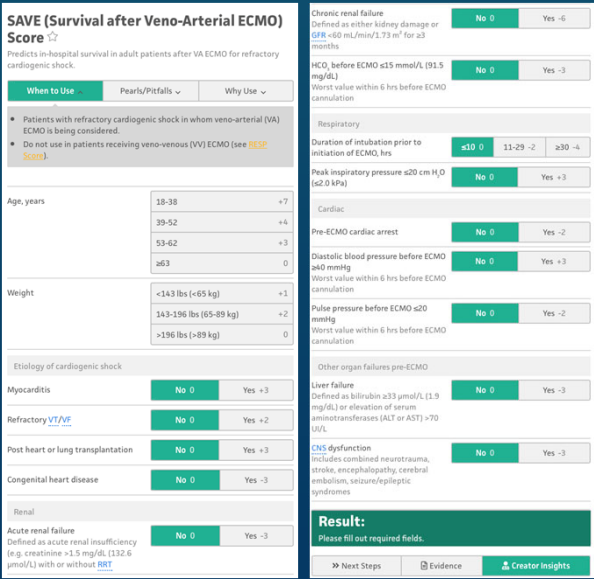

- Out of Hospital Cardiac Arrest (OHCA) with presumed cardiac etiology
- Inclusion Criteria:** bystander CPR within 5 min, first presenting rhythm was shockable (VF/VT), age 18-75, transfer time from the scene to the CV lab of <30 min and total CPR of <60 min
- Exclusion Criteria:** DNR/DNI, age >75, known terminal illness

Upon E-CPR Recognition

- Continue resuscitation per AHA ACLS guidelines
 - Place patient on mechanical CPR device (LUCAS™)
- Contact Abbott Northwestern at **612-863-3911** to page:
 - Level 1 E-CPR
 - ED physician for an E-CPR consult
- Activate emergency transport team
- Expose patient (gown only), obtain 12 lead EKG, and begin cooling (if >34° C apply ice packs to neck, groin, and axilla)
- Monitor with hands-free defibrillator pads, 2 IVs, and draw labs (ABG, BMP, CBC, and lactate)
- Transport directly to the ANW ED for continued resuscitation and prep for transfer to Cath Lab for ECMO cannulation

SAVE (Survival after Venous-Arterial ECMO) Score

Predicts in-hospital survival in adult patients after VA ECMO for refractory cardiogenic shock.

When to Use: Patients with refractory cardiogenic shock in whom veno-arterial (VA) ECMO is being considered. Do not use in patients receiving veno-venous (VV) ECMO (see [EESP Score](#)).

When to Use	Pearls/Pitfalls	Why Use
Age, years	18-38: +7 39-52: +4 53-62: +3 ≥63: 0	
Weight	<143 lbs (<65 kg): +1 143-196 lbs (65-89 kg): +2 >196 lbs (>89 kg): 0	
Etiology of cardiogenic shock		
Myocarditis	No 0 Yes +3	
Refractory VT/VF	No 0 Yes +2	
Post heart or lung transplantation	No 0 Yes +3	
Congenital heart disease	No 0 Yes -3	
Renal		
Acute renal failure	No 0 Yes -3	

Chronic renal failure: Defined as either kidney damage or GFR <60 mL/min/1.73 m² for ≥3 months. No 0 Yes -6

HCO₃ before ECMO: ≤15 mmol/L (91.5 mg/dL). Worst value within 6 hrs before ECMO cannulation. No 0 Yes -3

Respiratory

Duration of intubation prior to initiation of ECMO, hrs: ≤10 0 11-29 -2 ≥30 -4

Peak inspiratory pressure: ≤20 cm H₂O (±2.0 kPa). No 0 Yes +3

Cardiac

Pre-ECMO cardiac arrest: No 0 Yes -2

Diastolic blood pressure before ECMO: ≥40 mmHg. Worst value within 6 hrs before ECMO cannulation. No 0 Yes +3

Pulse pressure before ECMO: ≤20 mmHg. Worst value within 6 hrs before ECMO cannulation. No 0 Yes -2

Other organ failures pre-ECMO

Liver failure: Defined as bilirubin ≥33 μmol/L (1.9 mg/dL) or elevation of serum aminotransferases (ALT or AST) >70 U/L. No 0 Yes -3

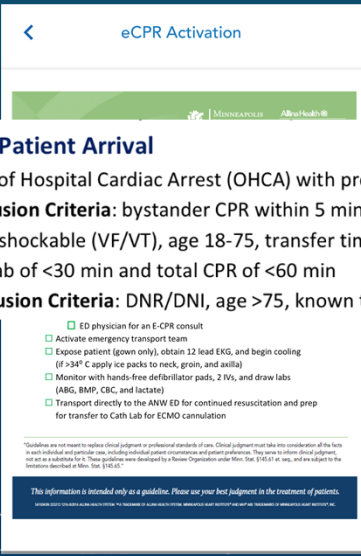

CNS dysfunction: Includes combined neurotrauma, stroke, encephalopathy, cerebral embolism, seizure/epileptic syndromes. No 0 Yes -3

Result: Please fill out required fields.

Bail Out for Vascular Catastrophe

- Size for patient, recognizing underlying PAD and vascular limitations
- Great working relationship with our vascular/cardiac surgeons
 - Every VA ECMO come with a vascular surgery consult
- Reasonable understanding of endovascular rescue techniques
 - Use of large balloons in aorta or iliac vessels
 - Coils for perforations
 - Covered stents
 - Thrombectomy
 - Retrieval and snare techniques
- Consider alternative access
 - Subclavian
 - Conversion to contralateral VA cannulation

Limb Ischemia

- Place transcutaneous continuous near-infrared spectroscopy (NIRS) patches on both calves as soon as cannulas are in place to obtain regional oxygen saturations (rStO₂).
- Decision to place anterograde perfusion catheter is made prior to departure from CV lab.
- Usually maintain rStO₂>50-60%
- Consider if:
 - If >15-20% drop after cannulation, difference of >10% between limbs, or absolute rStO₂<50%
 - Can use anterograde CFA, SFA or retrograde PDA, PTA
 - Ultrasound and fluoroscopic guided access with angiographic confirmation
- Low bilateral rStO₂ will require systemic and hemodynamic evaluation

What Can Go Wrong?

Everything: hope for the best, expect (plan for) the worst

- Patient selection
- Vascular
 - Bleeding
 - Ischemia
- IABP, Impella specific complications
- ECMO
 - Mechanical
 - Related to circuit, cannulas
 - Poor flow, thrombosis, bleeding, air
 - Kinking, cannula positioning
 - Hemodynamics
 - LV distension, unloading
 - Harlequin syndrome
- Neurological

25

Low Flow State

- **Prior to activating circuit**
 - Prime and inspect the system (perfusionist)
 - Appropriate anticoagulation before or as soon as cannulas are in place.
 - Back bleed and flush the system to ensure there is no thrombus or air
 - Appropriate positioning of the cannulas (occasionally VV instead of VA)
- **Low Flow**
 - Have perfusionist re-examine the circuit
 - Hypovolemia/bleeding
 - May see "chatter" and low pressure in drainage cannula.
 - May need to decrease drainage RPM
 - Use PA catheter, echo, arterial line, and colleagues to assist with decision making

Understanding the Hemodynamics Is it all about flow and MAP?

Figure 4. Hemodynamic changes that occur during acute cardiogenic shock and peripheral venoarterial extracorporeal membrane oxygenation (VA-ECMO) at increasing flow rates (1, 2, 3, 4, 4.75 L/min) with an unvented left ventricle (LV). **A.** LV volume and pressure increases. **B.** Aortic pressure (AOP) and left atrial pressure (LAP) increase. **C.** Right atrial pressure (RAP) decreases. **D.** Pressure-volume loops generated during acute cardiogenic shock and VA-ECMO at increasing flow rates. With increasing ECMO flow rates, aortic pressure and afterload (slope of the arterial elastance and end-systolic pressure increase). There is a concomitant decrease in stroke volume (represented by the width of the pressure-volume loop) and an increase in LV volume (LV distention) and LAP. As stroke volume approaches zero, this would clinically correspond to the aortic valve remaining closed throughout the cardiac cycle.

Rao et al, *Circ Heart Fail* 2018;11:e004905

Understanding the Hemodynamics Multi-factorial consideration

Amarelli et al, *Advances in Extra-Corporeal Perfusion Therapies, Chapter 13.*

30

Understanding the Hemodynamics LV venting options

III. LV Distention/Venting Strategy

PV loops during increasing ECMO flow rates

- ECMO increases LV afterload including LVEDP and wall tension
- Risk for LV distention

Options for LV Venting:

- Percutaneous transaortic VAD
- IABP
- Percutaneous LA vent
- Percutaneous LV vent
- Surgical LV vent

Best Practice:
Pulmonary artery catheter placement in all VA-ECMO patients. Low threshold for an LV venting strategy if concern for LV distention.

PV loop during ECMO with simultaneous use of percutaneous LVAD

Rao et al, *Circ Heart Fail* 2018;11:e004905

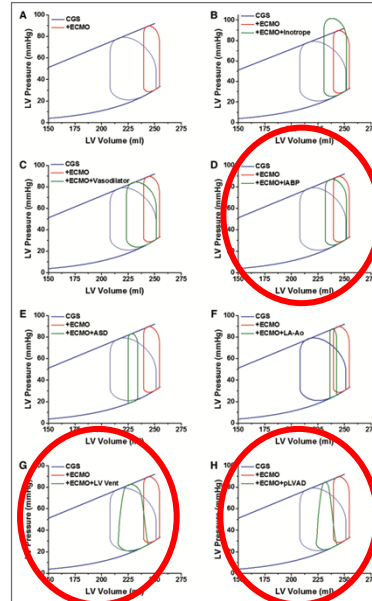

Figure 5. Hemodynamic effects of different strategies of left ventricular (LV) unloading during venoarterial extracorporeal membrane oxygenation (VA-ECMO). Pressure-volume (PV) loops generated during acute cardiogenic shock (blue PV loop) and peripheral VA-ECMO with (A) no unloading strategy (red PV loop) and with the following venting strategies (green PV loops): (B) mitotic agent, (C) vasodilator agent, (D) intra-aortic balloon pump (IABP), (E) atrial septostomy, (F) left atrial (LA) venting via cannula connected to ECMO circuit, (G) direct LV venting via cannula connected to ECMO circuit, (H) percutaneous transaortic ventricular assist device.

Neurological Complications

- Obviously very difficult to assess in the acute setting
- Embolic
- Hemorrhagic
- Seizures
- Monitoring
 - Low threshold for imaging if any trauma or obvious neurological abnormality
 - Cerebral near infrared spectroscopy (NIRS)
 - Transcranial doppler (TCD)
 - Electroencephalogram (EEG)

37

Greatest tool to minimize complications is a **TEAM APPROACH**

Advanced heart failure
Interventional Cardiology
Seasoned CV lab or OR team
Perfusion, IABP/Impella teams
CT surgery
Vascular surgery
ECMO Specialist Nurse
Intensivists, CICU nurses

****To optimize long term outcome, an even larger team is required****
